To: Our Codemanistani Manager
From: David Reed and Brendan Rejevich, Software Developers
Subject: Personal Reflection on Santorini

Through this project we learned that testing defensively and comprehensively is an important part of software development, since code that is hard to test likely to be wrong, and tests that pass for the "right" code will fail on future breaking changes. In addition, we learned some of the interesting corner cases to Go (and its libraries) and, more broadly, what issues to look for in new languages that may point to them being "teenage heartbreaks". Finally, we picked up on good practices for interface and component design which we will universally benefit from on all future engagements.
